New Features

pCon.facts 3.8 – New Features

Content

1   Editing Articles

With the upcoming version we will add the possibility to easily edit a saved article in your list. In the past, this was only possible by opening the article in the catalog, saving a copy to your list and deleting the old article.

If you tap an article, it will now be opened in the new edit mode instead of the "open in catalog" mode. If you still want to edit a copy, you can do it by using the context menu shown in figure 1.

2   Error Handling

When unknown errors occurred up until now, the application showed a dialog for reporting the error to our support or close the project. This could lead to a loss of your work results.

For the new version, we changed this behavior by adding an option to ignore the error. This makes it possible to save the progress and to continue the work.

2.1   Error Report Dialog

When reporting an error there is now a possibility to add some detail about the error right before opening the mail program. Optionally, you can also add an OBK file to your error report. If you have switched off the automatic error transmission, you do now also have the option to send the error report.

3 Catalog Search

Manufacturers with special characters can now also be found using normal characters. This method is more robust against errors but can also lead to more search results than expected.

4 Augmented Reality

We have changed the export of augmented reality files to a local version so that non article geometries are now also exported.

5 React Native Components

With this release, we are further improving the performance of our application by switching to more native components. The article list is now native.
